Exclusive GATE Coaching by IIT/IISc Graduates

# GATE Aerospace Coaching by Team IGC 

## Aircraft Structures Basics

Topics to Study

- Basic Elasticity
- Stresses
- Strain
- Stress-Strain Relationship
- Volumetric Strain
- Strain Energy
- Thermal Stress
- Compatibility Eqn and Airy Stress Function
- Axially loaded Member
- Torsion of Shaft
- Beam
- SFBM Diagram
- Bending and Shear Stresses
- Deflection of Beam
- Indeterminate Beam
- Thin Shell (Cylindrical and Spherical Shell)
- Buckling of Column (Euler Buckling Theory)
- Theory of Failure

Ref: Mechanics of Material by GERE
Aircraft Structures by Megson (1 ${ }^{\text {st }}$ Two Chapter)

## BASIC ELASTICITY

## Topics:-

1. Stresses
2. Strains
3. Stress-strain relationships
4. Volumetric Strain
5. Strain Energy
6. Thermal Stress
7. Compatibility equations
8. Airy stress function

Exclusive GATE Coaching by IIT/IISc Graduates

When a body undergoes deformation under the application of external forces, a restoring/resistance force is induced within the body. The intensity of force, i.e. restoring force per unit area is termed as stress.

$$
\operatorname{stress}(\sigma)=\lim _{\delta A \rightarrow 0} \frac{\delta P}{\delta A}
$$

Consider an arbitrary shaped body subjected to several loads as shown in figure

Here.
$\delta P_{n}=\delta P \sin \theta$

$$
\delta P_{5}=\delta P \cos \theta
$$

Reference plane for stresses

Under complex loading, for any given small area $\delta A$ the resultant force can be at any inclination. This resultant force (here stress) is resolved in two components.

Normal Stress: - (Normal to plane)

Exclusive GATE Coaching by IIT/IISc Graduates
A division of PhIE Learning Center

$$
\sigma=\lim _{\delta A \rightarrow 0} \frac{\delta P n}{\delta A}
$$

Shear Stress: - (Parallel to plane)

$$
\tau=\lim _{\delta A \rightarrow 0} \frac{\delta P s}{\delta A}
$$

Stress is a tensor quantity (2nd order tensor) (i.e.), it depends on magnitude, direction and the plane on which it acts.

Normal stress $(\sigma)$ can be tensile or compressive in nature depends on loading.
Generally, normal stress pointing away from plane or section is considered as tensile stress (+ve) while normal stress pointing towards the plane or section is considered as compressive stress (-ve).
$\rightarrow$ Normal stress is also termed as direct stress.

## - Notation and Direction of stresses

In tonsorial notation the stress is generally termed as $\sigma_{i j}$ or $\tau_{i j}$ two suffix for $2^{\text {nd }}$ order tensor, where
i - Indicates plane in which it acts
j - Indicates direction of action

In above figure plane $A B C D$ is ' $X$-plane'. There is a normal force and two shear stress in a plane of '3-D structure'. The normal stress in plane ABCD is noted as $\sigma_{x x}$. Similarly, shear stress $\tau_{x y}$ in y-direction and $\tau_{x z}$ in z-direction.

Some time, $\sigma_{x x}$ is also termed with $\sigma_{x}\left(\right.$ single $\left.\sigma_{x}\right)$.

## Direction:-

The normal stresses are defined as positive when they are directed away from their related surface.

Direction of shear stress depends on the corresponding direction of Normal stress

A division of PhIL Learning Center
If the tensile stress is in positive direction of the axis (say $x$ ), then corresponding shear stress are positive in other two positive direction of axis ( $y$ and $z$ ), while if tensile stress in opposite direction of axis (say -x), then corresponding positive shear stress are in direction opposite to positive direction of axis ( -y and -z ).

## - Stresses in 3-D Body

If any 3D body is subjected to external load it undergoes deformations which include strains and stresses. Consider a small (infinitesimal) particle of a 3-D body.

There are 3-planes in a cubical partial (X, Y, Z). In each plane (one normal stress and two shear stress).

There are total 9-stresses in a 3-D body. In terms of matrix,

$$
[\sigma]=\left[\begin{array}{ccc}
\sigma_{x x} & \sigma_{x y} & \sigma_{x z} \\
\sigma_{y x} & \sigma_{y y} & \sigma_{y z} \\
\sigma_{z x} & \sigma_{z y} & \sigma_{z z}
\end{array}\right]
$$

- Stresses in 2-D Body

Consider a plate of unit thickness as shown

Exclusive GATE Coaching by IIT/IISc Graduates

## - Equations of Equilibrium

For 2-D stress system
Consider the variation of stress along the element as well. Let the body forces in x and $y$ directions are $X$ and $Y$ per unit volume.

$\Rightarrow$ Taking moments about an axis through the centre of the element parallel to the zaxis,
$\sum M_{o z}=0$
$\left(\sigma_{x y} d y\right) \frac{d x}{2}+\left(\sigma_{x y}+\frac{\partial \sigma_{x y}}{\partial x} d x\right) d y \frac{d x}{2}-\sigma_{y x} d x \frac{d y}{2}-\left(\sigma_{y x}+\frac{\partial \sigma_{y x}}{\partial y} d y\right) d x \frac{d y}{2}=0$
Ignoring higher order term and dividing by dx.dy;

$$
\sigma_{\mathrm{xy}}=\sigma_{\mathrm{yx}}
$$

Above expression shows that shear stresses are of complementary nature and on two perpendicular plane, shear stresses has same magnitude and either they approach each other or will go away from each other.

A division of PhIE Learning Center
Now Force Equilibrium
$\Rightarrow$ Considering the equilibrium of the element in x-direction, $\sum F_{x}=0$

$$
\begin{align*}
& \left(\sigma_{x}+\frac{\partial \sigma_{x}}{\partial x} d x\right) d y-\sigma_{x} d y+\left(\sigma_{y x}+\frac{\partial \sigma_{y x}}{\partial y} d y\right) d x-\sigma_{y x} d x+X d x d y=0 \\
& \rightarrow \frac{\partial \sigma_{\mathrm{x}}}{\partial \mathrm{x}}+\frac{\partial \sigma_{\mathrm{yx}}}{\partial \mathrm{y}}+\mathrm{X}=0 \tag{1}
\end{align*}
$$

Similarly,

$$
\begin{equation*}
\rightarrow \frac{\partial \sigma_{\mathrm{y}}}{\partial \mathrm{y}}+\frac{\partial \sigma_{\mathrm{xy}}}{\partial \mathrm{x}}+\mathrm{Y}=0 \tag{2}
\end{equation*}
$$

$\rightarrow$ These above two equations are equilibrium equations for stresses in 2-D system.

- For 3-D stress system

$$
\begin{align*}
\rightarrow \frac{\partial \sigma_{\mathrm{x}}}{\partial \mathrm{x}}+\frac{\partial \sigma_{\mathrm{yx}}}{\partial \mathrm{y}}+\frac{\partial \sigma_{\mathrm{zx}}}{\partial \mathrm{z}}+\mathrm{X} & =0  \tag{1}\\
\rightarrow \frac{\partial \sigma_{\mathrm{y}}}{\partial \mathrm{y}}+\frac{\partial \sigma_{\mathrm{yx}}}{\partial \mathrm{x}}+\frac{\partial \sigma_{\mathrm{yz}}}{\partial \mathrm{z}}+\mathrm{Y} & =0  \tag{2}\\
\rightarrow \frac{\partial \sigma_{\mathrm{z}}}{\partial \mathrm{z}}+\frac{\partial \sigma_{\mathrm{zy}}}{\partial \mathrm{y}}+\frac{\partial \sigma_{\mathrm{zx}}}{\partial \mathrm{x}}+\mathrm{Z} & =0  \tag{3}\\
\sigma_{\mathrm{xy}} & =\sigma_{\mathrm{yx}} \\
\sigma_{\mathrm{yz}} & =\sigma_{\mathrm{zz}} \\
\sigma_{\mathrm{xz}} & =\sigma_{\mathrm{zx}}
\end{align*}
$$

Exclusive GATE Coaching by IIT/IISc Graduates

## Problems

## 1.

The components of stress in a body under plane stress condition, in the absence of body forces, is given by:
$\sigma_{x x}=A x^{2} ; \sigma_{y y}=12 x^{2}-6 y^{2}$ and $\sigma_{x y}=12 x y$.
The coefficient, A , such that the body is under equilibrium is $\qquad$ (accurate to one decimal place).

Sol. -
Applying Equilibrium Equation for 2D stress system in the absence of body forces

$$
\begin{align*}
& \rightarrow \frac{\partial \sigma_{\mathrm{x}}}{\partial \mathrm{x}}+\frac{\partial \sigma_{\mathrm{yx}}}{\partial \mathrm{y}}=0  \tag{1}\\
& \rightarrow \frac{\partial \sigma_{\mathrm{y}}}{\partial \mathrm{y}}+\frac{\partial \sigma_{\mathrm{yx}}}{\partial \mathrm{x}}=0 \tag{2}
\end{align*}
$$

From equation-1

$$
2 A x+12 x=0
$$

$$
A=-6
$$
