* Aircraft Stability *

"Any Mechanical system when subjected to the small disturbance and if the system tends to maintain its original equilibrium state by applying restoring force, then the system is said to be stable."

→ If the system does not react to the disturbance and maintain its new position as an equilibrium state, then the system is said to be 'Neutrally Stable'

→ If the system react to the disturbance and keep moving away from its original equilibrium state, then the system is called 'Unstable system'.

Stable
or Positive

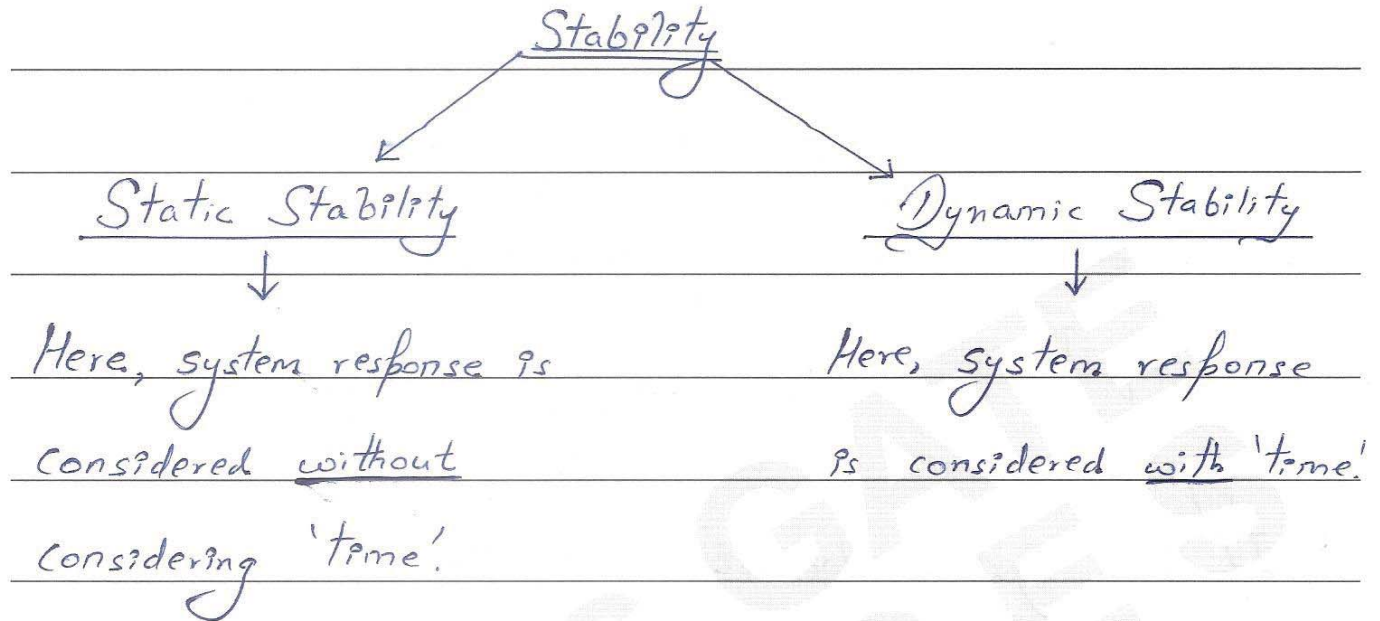

Neutral

Unstable
or Negative

A division of PhIE Learning Center

→ A system can be statically stable without being dynamically stable. That is, a statically stable system may not be dynamically stable.

A division of PhIE Learning Center

Dynamic Stability

Positive
or
Stable

Neutral

Negative
or
Unstable

(i) Positive dynamic stability

"When system is statically stable and tends to attain the equilibrium position by an "underdamped" oscillation."

A division of PhIE Learning Center

(ii) Neutral Dynamic Stability

"A mechanical system which tends to achieve original equilibrium position but keeps overshooting it by oscillating about it with a "constant" amplitude."

(iii) Negative Dynamic Stability

"A mechanical system which tends to achieve original equilibrium position but keep overshooting it by oscillating about it with "increasing" amplitude with time."

Sign notation:

With respect to C.G. of an aircraft

→ For Pitching, Nose up → +ve

Nose down → -ve

→ For Rolling, Right wing (Star^{board} Side) down → +ve

Right wing (Star^{board} Side) up → -ve

→ For Yawing, turning towards right wing → +ve

away from right wing → -ve

Moments on the Airplane

"A study of stability and control is focused on moments."

→ The moment can be taken about any arbitrary point, i.e., leading edge, trailing edge, or Aerodynamic center of the wings.

Moment at Aerodynamic Center:

"As per definition of Aerodynamic Centre, the pitching moment coefficient remains constant with all angle of attack."

$$\therefore, C_{mac} = \frac{M_{ac}}{q_{\infty} S c} = \text{Constant}$$

Now at zero lift condition for a flying wing.

A division of PhIE Learning Center

$$C_{mac} = (C_{m, c/a})_{L=0} = C_{m, \text{any point}}_{L=0}$$

→ Hence C_{mac} can be obtained from the value of the moment coefficient about any point when the wing is at the zero-lift angle of attack ($\alpha_{L=0}$).

→ Moment on Airplane

→ Consider the system of forces as shown in figure.

→ Moment about C.G. of an aircraft will be calculated for L , D and M_{ac} of the wing, thrust of the aircraft,

lift of the tail, and aerodynamic forces and moments on other parts of the aircraft.

$$\therefore M_{cg} = f(L, D, T, L_{Tail}, \text{other forces})$$

Here, weight of the aircraft will not be considered for obvious reasons.

$$\therefore C_{m_{cg}} = \frac{M_{cg}}{q_{\infty} S c} = \frac{f(L, D, T, L_{Tail}, \text{Other forces})}{q_{\infty} S c}$$

→ All the discussions of the stability of an airplane will be done by considering $C_{m_{cg}}$.
